

approximately 24 hours, the water must have been moving towards the Sunrise at a greater mileage per hour than the surface of the Earth: therefore the water which hit what is now the Mediterranean had a motion from West to East proportioned to the difference of their circumferences. A motion so great that it sunk every ship then on the ocean: and would have swamped Noah but that he had built his vessel so high above Sea level that it remained on dry land for more than five weeks after the ring began to break.

Thus Science fills in with details the brief report of that event which has been given to us by Moses.

ERNEST G. GEOGHEGAN.
